

Situation: NetApp had AI solutions in market but no unified story. Multiple teams were pulling in different directions, and the content team was blocked waiting for positioning clarity before they could build anything.

Complication: Getting to a single message required reconciling executive input, analyst recommendations from IDC, sales requests for audience-specific versions, and a buyer priority framework, all simultaneously. Five versions in, the core tension was unresolved: NetApp's strongest differentiators (AI Control Plane, DataOps Toolkit, native data protection, first-party cloud integration) lived in the "unexpected delight" quadrant, but the market was asking for proof, not promise. The guiding principle, "path to predictable over art of the possible," had to hold across every audience from data scientists to CxOs without losing specificity.

Resolution: Ten weeks from kickoff, the team landed a reconciled message board aligned across executives and IDC. The final position centered on a unified hybrid data architecture as the category, with "Is your data AI ready?" as the market-facing anchor. PMMs and creative teams received a complete handoff package on November 1, including tiered copy at 25, 50, 100, and 200 words, audience-specific positioning for five buyer segments, and validated proof points with quantified claims.

NETAPP AI

Messaging & Positioning Workbook

 LAST UPDATE: 11.01.23

The guiding principle for our messaging

Most of the market is
not interested in the
art of the possible ...

...they want the
path to predictable

Result We Intend To Have: A clear, easily told and well understood story

Based upon clear Positioning, the marketing teams must then add the remaining components of differentiation:

- Customer Experience,
 - Business Practices, and
 - Services and Support
- to arrive at a unique and defensible narrative

Customer Experience

- Brand, reputation
- Owning experience
- "Whole company" value
- Business impact and growth
- Customer programs

Business Practices

- Pricing model
- Packaging
- Sales processes, practices
- Business partners
- Buying experience

Product

- Feature/Function
- Architecture
- Interoperability
- Deployment
- Usability
- Technology partners
- Product vision

Services

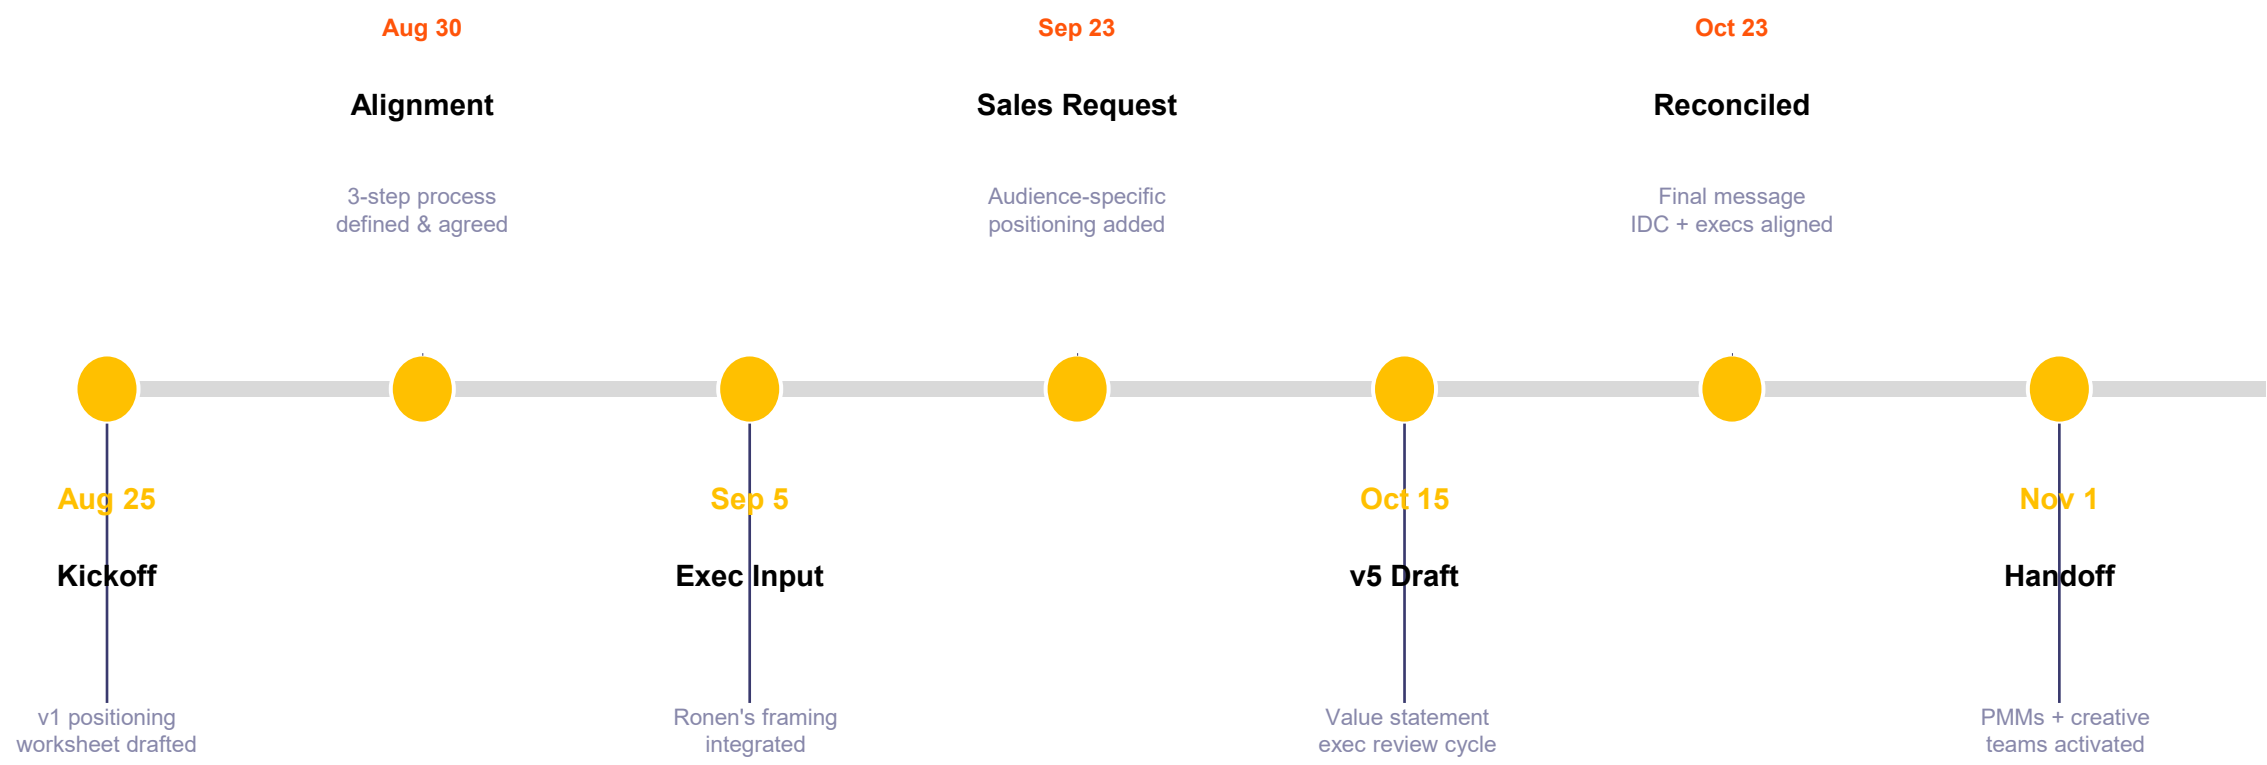

- Services and support
- Implementation
- Technical skills
- Domain expertise
- Geographic presence
- Delivery partners

AI Positioning: Development Timeline

MG to loop in creative team during Zoom mtgs

Review Process

Names and comments removed

Early Stage GTM Strategies

- Prepare for collaborative, highly technical engagements
- Be prepared for rapid response to customer requests
- Less demand for case studies and rich content
- **Discover repeatable, high impact value scenarios**

Maturing Market GTM Strategies

- Lead with high-impact value scenarios
- Build a content arsenal of the buyer and change enablement
- Try “whole product” approaches to reduce risk
- **Discover the most effective buying approaches and content**

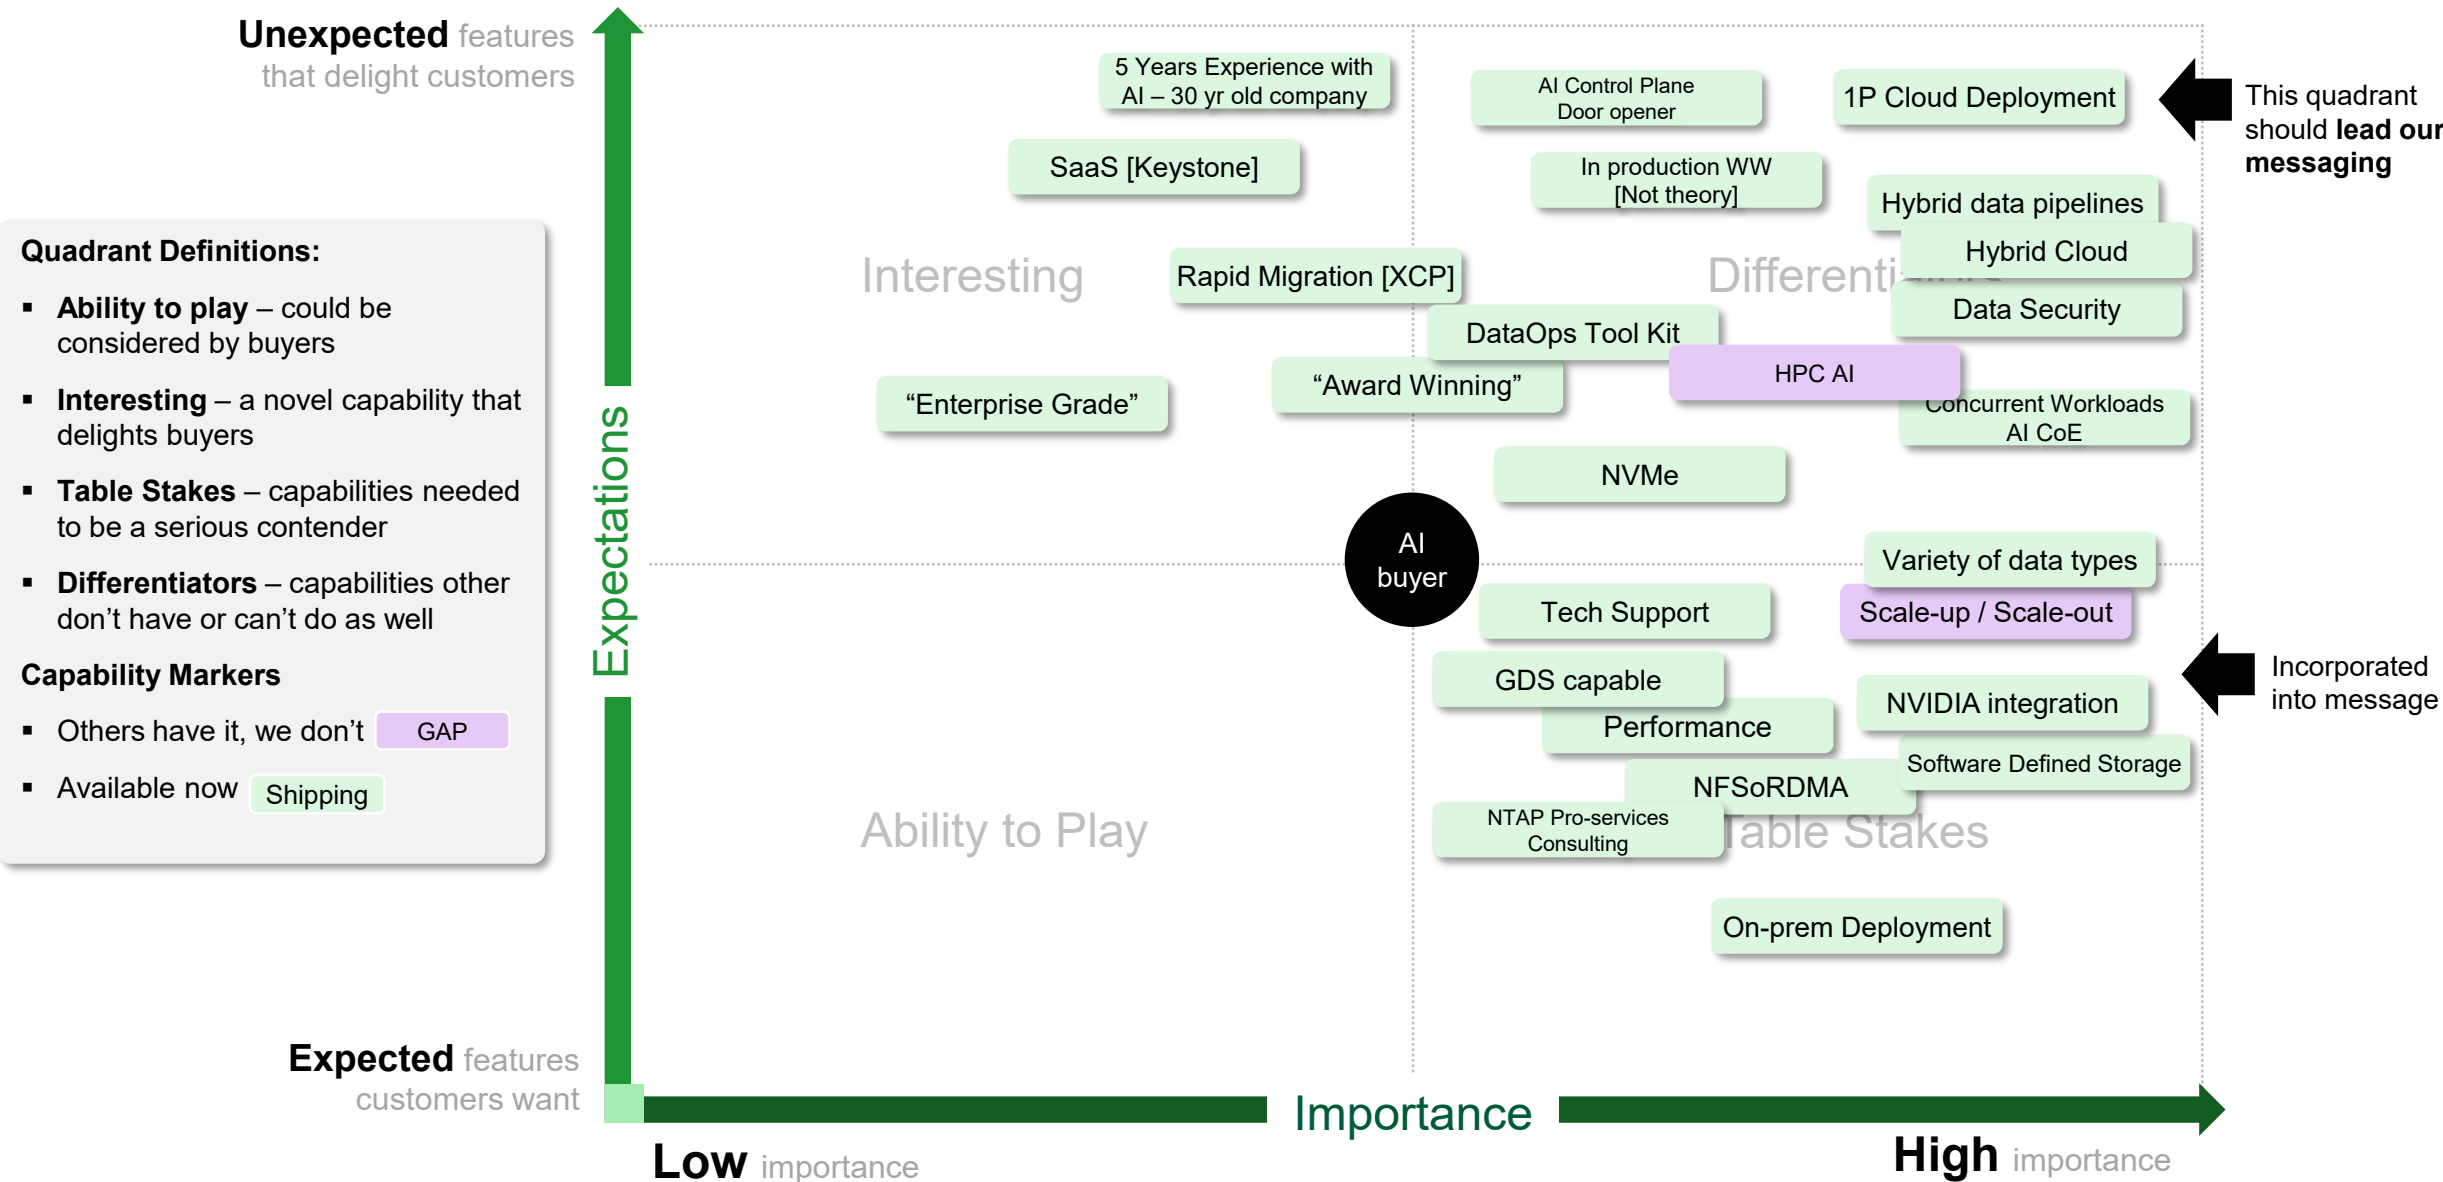

Established Market GTM Strategies

- Provide a prescriptive buying path/qualify aggressively to avoid wasting time
- Focus innovations on reducing change and addressing nagging issues
- Reduce content library to focus on the most effective pieces
- **Capture concerns to evaluate enhancements to reduce change/risk**

Buyer priorities and expectations.

Unified Message Board w/ IDC recommendations

11.01.23 Handed off to PMMs
and creative teams

Overall Message

AI transformation is here, supercharged by generative AI. It is disrupting industries and changing job profiles, while promising trillions in new economic value.¹ The challenge for CxOs now is figuring out how to capitalize on the power of AI and Generative AI for their business, while doing so at scale, efficiently and responsibly. Corporate data needs to stay protected but accessible for the myriad of AI uses cases. As data continues to grow exponentially, each AI project requires an integrated, secure data pipeline and an infrastructure that scales consistently across all deployments i.e., A unified hybrid data architecture, optimized for AI and Generative AI. Simply put, AI and Generative AI initiatives are successful with data. Data runs on NetApp. So, the question is: Is your data AI ready?...

Key Points

Flexibility

AI requires the right data, at the right location and the right time. A unified hybrid data architecture provides flexibility at scale.

Implement best-of-breed on-premises AI-optimized unified storage accessible via file, block, or object protocols.

- Extend AI initiatives to the cloud with on best-of-breed, first-party cloud services from Amazon, Microsoft, and Google built with NetApp IP

Scale your entire AI data architecture with validated software from our industry-leading AI partners like NVIDIA.

Governance

AI relies on enormous amounts of data. A unified hybrid data architecture provides rigorous governance and security.

- Protect your data against exposure and risk – no matter where and what format your data resides – by removing sensitive or biased information from ingestion before it's used to train AI.
- Automatically create auditable copies of AI models for traceability and error detection.
- Identify cyber threats, including malicious insiders, in real-time with AI and ML-driven anomaly detection, protecting your most important, confidential, and commercially critical datasets.

Rely on the highest level of security validated by the Commercial Solutions for Classified (CSfC) Program, led by the U.S. National Security Agency

Efficiency

AI is resource intensive. A unified hybrid data architecture is optimized to use datacenter assets more efficiently and sustainably.

- Implement AI efficiently by minimizing idle power of your AI infrastructure resources.
- Maximize utilization, and optimal usage of your high-powered accelerators (e.g., GPUs).
- Use data observability to create to filter unnecessary or unused data, and extraneous data copies.

Productivity

AI is about innovation. A unified hybrid data architecture enables IT operations, data scientists, engineers, and developers to be more productive.

- Enable IT Ops teams to manage and optimize your disparate AI data sources, especially unstructured, to accelerate training, finetuning, and inferencing across hybrid multicloud environments.
- Enable your data scientists and engineering teams improve data pipeline efficiency and speed time to insights by automating their AI training workflows, simplifying provisioning, and using full-stack, open-source tooling.

Enable your developers to extract value from data, in whatever form (e.g., static or streamed unstructured, sem- structured, synthetic, and structured data) or location it exists.

Why NetApp AI?

- NetApp - a pioneer in data infrastructure - enables you to take a unified, full stack approach for your AI and Generative AI initiatives, enabling your IT, data scientists and developers to be more productive.
- NetApp enables you to integrate, access and manage the full lifecycle of your AI data, wherever it is located, and however it may be accessed.
- NetApp's partnerships with leading software vendors lead to open, flexible integration with AI software stacks, thus ensuring that your data infrastructure remains optimized, scalable, secure, and efficient.

NetApp's AI Solution Benefits

- **Unified Hybrid Data Architecture:** A unique storage architecture that enables a consistent approach to deploying AI initiatives on-premises and in the cloud, with NetApp's industry leading platforms, systems, and cloud services.
- **Free-flowing data pipeline:** Consolidated and highly scalable data environment enables you to drive more data at greater efficiency to support your AI workloads.
- **Advanced integration and hybrid multicloud capabilities:** Capitalize on open-source integrations and tooling - Kubernetes, Kubeflow, Kafka, Spark, NetApp Astra Trident, and more – for simplified deployment, portability, and a cloud-anywhere experience for your AI.
- **Open-source AI orchestration:** Add a fully managed distributed streaming platform to your AI portfolio by giving users real-time, event-driven data processing, data caching, session management, real-time analytics, and a landing zone for structured and unstructured data.
- **Intelligence-driven speed:** Get more throughput with lower latency to create different tiers of data service and fully utilize accelerators (e.g., GPUs) in concurrent processing environments.
- **Fast, efficient dataset copies:** Copies completed in seconds instead days, then stored efficiently, resulting in faster access to training datasets without worrying about storage space.
- **Hit the ground running:** Validated solutions, blueprints, managed data pipelines, faster data access and portability, Ansible integration for 20-minute configurations.

Draft Value Statement based upon the concept of creating a NetApp AI data ecosystem

Why Change

AI requires a new data architecture. One that addresses a counterintuitive problem: overly-streamlined data environments strangled by decades of application-centric thinking that trapped data in silos limiting its use. Those rigid architectures leave organizations unable to unlock their data complementary suites of technologies to enable AI operations for those that need them the most, data scientists and data consumers.

Why Now

The AI landscape is changing fast, and mastery of the technology will result in winners and losers. Unlocking decades of data requires a different approach, a data technology partner that embraces the paradox of today's AI environment. A partner that is an expert in traditional data-centers, yet fully integrated technology with cloud service providers. The developer of the industry's leading storage OS with deep expertise in AI opensource tools and frameworks. And a partner with a 5-year head start on typical vendors so you get the experience and certainty that can only come from having deployed hundreds of AI solutions

Why NetApp

For enterprise organizations using data as a competitive catapult, NetApp is building **the industries most fluid data ecosystem for AI** that eliminates the challenges between data management and data consumption, excessive cost and intolerable latency so taxed technology teams can innovate rather than administrative

Position by Audience

Requested by
sales 09.23.23

1. **For AI-driven enterprises** that need to scale and manage complex AI workloads and want a comprehensive, integrated solution, the NetApp Data ecosystem is a data management solution that leverages partnerships with industry giants like Microsoft, Google, and NVIDIA that enables seamless control and scalability across regions and sites using Kubernetes.
2. **For data scientists and AI teams** that require collaboration and rapid development environments and want an efficient way to provision and share workspaces, the NetApp Data ecosystem is a data management solution that provides Python-based tools like the DataOps Tool Kit that facilitates collaboration and easy management of datasets, experiments, and models.
3. **For organizations looking to transform with AI** that need a streamlined approach to AI, ML, and deep learning data management and want to utilize AI as a strategic differentiator, the NetApp Data ecosystem is a data management solution that offers AI Control Plane for full-stack AI data and experiment management that ensures efficient physical storage space utilization.
4. **For businesses demanding on-demand AI capabilities** that need to handle massive data sets and deliver computational performance for deep learning challenges and want turn-key solutions, the NetApp Data ecosystem is a data management solution that integrates with partners like NVIDIA that provides scalability and comprehensive management to support their transformative visions for AI.
5. **For cloud-centric organizations needing verified reference architecture** and solutions for AI workloads and want ease of integration with cloud platforms, the NetApp Data ecosystem is a data management solution that provides cloud-connected solutions with major cloud providers like Microsoft, Google, AWS, and IBM that offers simplicity and joint engineering with partners like NVIDIA so users can “keep things complex” to maintain a competitive edge.

Overall Message

10-23-2023

Now Reconciled with NetApp Executives and IDC

Overall message	AI transformation is here, supercharged by generative AI. It is disrupting industries and changing job profiles, while promising trillions in new economic value.* The challenge for CxOs now is figuring out how to capitalize on the power of AI and Generative AI for their business, while doing so at scale, efficiently and responsibly. Corporate data needs to stay protected but accessible for the myriad of AI uses cases. As data continues to grow exponentially, each AI project requires an integrated, secure data pipeline and an infrastructure that scales consistently across all deployments i.e., a unified hybrid data architecture, optimized for AI and Generative AI. Simply put, AI and Generative AI initiatives are successful with data. Your data must be made AI-ready and your interlocking Data Science, Application Development and ITOps teams supported by a data architecture that simplifies and accelerates their critical work.
-------------------------------	---

Detailed Message

10-23-2023

Key points	Flexibility <i>AI requires the right data, at the right location and the right time. A unified hybrid data architecture provides flexibility at scale.</i> Implement unified storage to make data accessible via file, block, or object protocols across cloud or on premises Take advantage of first-party storage integration with native AI services from Amazon, Microsoft, and Google Seamlessly and safely integrate private data with Cloud AI services to enhance the value of models to your business. Scale your entire AI data architecture on demand with validated solutions from industry-leading AI partners.	Governance <i>AI demands the responsible use of data. A unified hybrid data architecture enables policy driven governance and security.</i> Protect your data against exposure and risk – no matter where and what format your data resides – by removing sensitive or biased information from ingestion before it’s used to train AI. Automatically create auditable copies of AI models for traceability and error detection. Identify cyber threats, including malicious insiders, in real-time with anomaly detection, protecting your most important, confidential, and commercially critical datasets.	Efficiency <i>AI is resource intensive. A unified hybrid data architecture optimizes resources for cost, efficiency, and sustainability.</i> Implement AI efficiently by maximizing the utilization of your expensive compute resources (i.e., GPUs) Utilize actionable recommendations to right-size your storage infrastructure for delivering AI projects sustainably. Filter unnecessary or unused data sets and data copies to reduce resource wastage. Continuously optimize your AI resource costs across on-premises and the cloud.	Productivity <i>AI is about innovation. A unified hybrid data architecture enables IT operations, data scientists, data engineers, and developers to collaborate and be more productive.</i> Enable IT Ops teams to manage and optimize your disparate AI data sources, especially unstructured, to accelerate training, fine-tuning, and inferencing across hybrid multi-cloud environments. Enable your data scientists and data engineering teams to improve data pipeline efficiency and speed time to insights by automating their AI training workflows, simplifying provisioning, and using full-stack, open-source tooling. Enable your developers to extract value from data, in whatever form (e.g., static or streamed unstructured, semi-structured, synthetic, and structured data) or location it exists.
------------	--	---	---	--

Why NetApp AI?

- NetApp – a pioneer in hybrid data infrastructure – enables you to take a unified, full stack approach for your AI and Generative AI initiatives, enabling your IT, data scientists and developers to be more productive.
- NetApp enables you to integrate, access and manage the full lifecycle of your AI data, wherever it is located, and however it may be accessed.
- NetApp's partnerships with leading software vendors lead to open, flexible integration with AI platforms, thus ensuring that your data infrastructure remains optimized, scalable, secure, and efficient.

NetApp's
AI Solution
Benefits

Unified Hybrid Data Architecture: A unique storage architecture that enables a consistent approach to deploying AI initiatives on-premises and in the cloud, with NetApp’s industry leading platforms, systems, and cloud services.

Free-flowing data pipeline: Consolidated and highly scalable data environment enables you to drive more data at greater efficiency to support your AI workloads.

Advanced integration and hybrid multicloud capabilities: Capitalize on open-source integrations and tooling - Kubernetes, Kubeflow, Kafka, Spark, NetApp Astra Trident, and more – for simplified deployment, portability, and a cloud-anywhere experience for your AI.

Open-source AI orchestration: Add a fully managed distributed streaming platform to your AI portfolio by giving users real-time, event-driven data processing, data caching, session management, real-time analytics, and a landing zone for structured and unstructured data.

Intelligence-driven speed: Get more throughput with lower latency to create different tiers of data service and fully utilize accelerators (e.g., GPUs) in concurrent processing environments.

Fast, efficient dataset copies: Copies completed in seconds instead days, then stored efficiently, resulting in faster access to training datasets without worrying about storage space.

Hit the ground running: Validated solutions, blueprints, managed data pipelines, faster data access and portability, Ansible integration for 20-minute configurations.

OLD & BACKGROUND MATERIAL

WIP Positioning Narrative [updated with Ronen input 09/05]

For large-to-mid-size firms in public and enterprise sectors aiming to achieve growth, innovate, and boost efficiency via large-scale AI initiatives, the struggle to get meaningful data-driven results often arises because they've underestimated their current environment's capability to organize and curate their disparate datasets. NetApp, with its unique architecture on-prem and in the cloud, brings a solution to this bottleneck by increasing the relevance of results for users.

- NetApp automatically augments internal enterprise data by creating vector embeddings, enhancing data quality to feed AI projects at scale.
- It also enables firms to use the same public data sources as their competitors, but tailor the results through the lens of their own internal data.
- And finally, NetApp can produce clones of production data to enable LLMs, without risking or exposing sensitive production data.

This leaves clients with enhanced, more insightful data while reducing the complexity of data management pipelines, especially in hybrid setups.

These buyers want a flexible data architecture with enhanced data security, flexible deployment options, and enterprise-grade, cloud-connected data pipelines. For these firms, the NetApp Data ecosystem integrates with cloud giants such as Microsoft, AWS, Google, and IBM.

Built on the world's leading storage OS, ONTAP, NetApp is designed to deploy a scalable and performant data ecosystems within weeks rather than years. With full NVIDIA integration, global consulting, and technical support, as well as flexible consumption options, buyers get a high-performance data architecture matched to their AI ambitions.

Having spent over three decades perfecting dynamic scale-up and scale-out storage architectures and integrated data services, NetApp is a market leader in AI solutions. For those requiring extreme machine learning and deep learning (ML/DL) workloads, NetApp offers industry-leading throughput. For those with less-demanding needs, NetApp can reduce data management overhead and complexity.

NetApp's AI solutions come with value-add tools such as the AI Control Plane and DataOps toolkit, ensuring auditability and governance, all easily managed through NetApp's unified hybrid multicloud console, BlueXP. With BlueXP, all AI solution customers can manage their entire data estate through a single console, giving them a comprehensive, flexible, and efficient solution to move AI projects into production.

NetApp AI value property worksheet

Version 4 WIP
Ronen inclusions

FOR target organization	Large-to-mid-size firms in public and enterprise sectors aiming to achieve growth, innovate, and boost efficiency via large-scale AI initiatives.
WHO statement of need	Struggle to get meaningful data-driven results from their AI because they've underestimated their current environments capability to access, organize, and curate their disparate datasets to feed their AI projects at scale. This leaves them with inadequate data for their models or protracted, staff-intensive data transformation processes. Add: LLMs use massive amounts of ingested public data to 'learn' and build their intelligence base (as opposed to data base). Enterprises store their internal data in on-premises systems – big, secure, stable
AND WANT statement of expectations	A flexible data architecture capable of pulling from a wide variety of structed and unstructured data to feed their AI analysis that includes enhanced data security, and flexible deployment options, alongside enterprise-grade, cloud-connected data pipelines for data access and management so they can finally move their AI projects into production.
THE solution	NetApp's storage and data services solutions for AI - <i>built on the world's leading storage OS</i> - were developed through real-world customer-driven use cases then converted to functional frameworks and reference architectures so organizations could quickly deploy highly scalable and performant data ecosystems suited to their needs within weeks rather than years. With full NVIDIA integration, global consulting and technical support, as well as flexible consumption options, buyers get a high-performance data architecture, deployable on-premise, in a public cloud or hybrid environment giving them near-instant impact with an affordable investment Add: increases the relevance of results for a user by bringing their internal (proprietary) enterprise data to GenAI and automatically [augments the data by] creating vector embeddings augment the same public data sources that their competition can access, but tailored through the lens of their own internal data – giving them deeper insight, more wisdom, and a greater competitive advantage...and to do so in a way that keeps their data and operational systems safe and secure; Proof Points include: AI-tagged volumes to extract and syn defined data sources, making them available to your LLMs with the public data sources. Clones of production data to enable AI LLM volumes - without risking or exposing production data reduce the complexity of data management, pipelines when tapping into this knowledge, especially when moving hybrid
IS category	Dynamic scale-up and scale-out storage architecture and integrated data services underpinned by the world's leading storage OS, ONTAP that enables optimal performance for data driven AI while also handling other concurrent workloads reducing data management overhead and complexity for already taxed technology teams.
THAT compelling reason to buy	Integrate and streamline workflows for data science teams and integrate multi-site/multi-platform data pipelines that maximize ROI and are easily managed though NetApp's unified hybrid multicloud console, BlueXP. Through BlueXP, AI solution customers get unified management of the entire data estate — services, resources, workloads, infrastructure, policies, protection, classification— wherever the organizations data resides.
UNLIKE competitive alternative	Pure, Dell EMC, DDN, Weka or Vast none of whom offer 1) value-add AI tools such as NetApp AI control plane for full-stack, open-source tooling, or NetApp's DataOps toolkit boosting data scientist productivity 2) built in data protection so their buyers must integrate a 3 rd party cyber resilience suite, and 3) first party cloud integration with hybrid/multicloud data management like Blue XP

200 Word Version [includes Ronen input]

In a world where data drives innovation, your company's pursuit of cutting-edge AI applications often hits a wall: the complexity and safety of managing diverse data sets. NetApp's Data Ecosystem for AI isn't just a solution; it's your competitive advantage.

- Our unique architecture, both on-prem and in the cloud, elevates your AI projects. With advanced data management and mobility technologies, we increase the relevance of your results.
- Helping you take advantage of GenAI, we bring your proprietary enterprise data to the forefront, enhancing it through vector embeddings. This doesn't just make your data smarter; it makes your business smarter.
- Don't be limited to your internal data, augment it with public data, viewing it through the lens of your enterprise data. Your insights aren't just deep; they're unparalleled, providing you a competitive edge.

Proof Points:

- Leverage AI-tagged volumes to extract defined data sources, integrating them seamlessly with your LLMs and public data.
- Use clones of production data for AI initiatives without ever compromising the safety of your operational systems.
- Simplify your data management pipelines, particularly when operating in hybrid environments, reducing both overhead and risk.

From flexible deployment options to unmatched data governance via our BlueXP console, NetApp positions your business to leap ahead in the AI landscape—securely, efficiently, and intelligently.

50 Word Version [includes Ronen input]

Elevate your enterprise's AI capabilities with NetApp's Data ecosystem. Seamlessly integrating with industry leaders like Microsoft, AWS and Google. Our unique on-prem and cloud architecture simplifies complex data management, amplifies AI insights, and comes with security built in never bolted on. With native governance tools and decades of market leadership, NetApp transforms your AI ambitions into business success

Ronen's input **Sep 5, 2023**

From Ronan

Current Cloud Storage/AI positioning:

- Most LLMs use massive amounts of ingested public data to 'learn' and build their intelligence base (as opposed to data base)
 - Data fuels data...the more data, the better chance for the "i" in AI
- Enterprises store their internal data in systems like NetApp's – big, secure, stable
 - NetApp fuels our customers' ability to store and tap into their data
 - And using their own data – along with public data – is what brings relevance to those vast sums of knowledge
 - Literally – this is the difference between 'wisdom' and 'knowledge' embodied in technology
- NetApp – with a unique architecture on-prem and in the cloud, with advanced data management and mobility technologies, allows them to
 - **increases the relevance** of results for a user by bringing their internal (proprietary) enterprise data to GenAI and automatically [augments the data by] creating vector embeddings
 - **augment the same public data sources** that their competition can access, but tailored through the lens of their own internal data – giving them deeper insight, more wisdom, and a greater competitive advantage...and to do so in a way that keeps their data and operational systems safe and secure; Proof Points include:
 - AI-tagged volumes to extract and syn defined data sources, making them available to your LLMs with the public data sources.
 - Clones of production data to enable AI LLM volumes - without risking or exposing production data
 - **reduce the complexity of data management**, pipelines when tapping into this knowledge, especially when moving hybrid

Positioning versus Brand Narrative versus Sales Messaging

08/30/23
We are here

STEP 1 – GET AGREEMENT

Portfolio Positioning

Positioning is often used in place of value proposition and vice versa (sometimes both get confused with messaging)

Positioning isn't a tagline, a slogan or something built around product features.

Positioning is an internal document that answers the question: **Why did we develop a solution and to whom will we attempt to sell it and why would a buyer want to buy it.**

STEP 2 – TEST POSITION

Competitor Swap Test

1. Use positioning document to select key messages
2. Replace our solution with that of our competitors
3. If the position is still credible, then we don't have differentiations and must start again

STEP 3 – DEVELOP AND VALIDATE

Brand Narrative

Developed by the content team for use in digital content development and to advertise the NetApp's solution offerings

Sales Messaging

Brings up "Unconsidered needs" and NetApp's "Unique Strengths" so prospects consider why their current situation is untenable and a change is required

Overall message	AI transformation is here, supercharged by generative AI. It's already disrupting industries and jobs, while promising trillions in new economic value.* The challenge now is capitalizing on the power of AI for your business while doing it responsibly. Corporate data needs to stay protected but accessible for myriad AI uses cases. Each AI project requires an integrated, secure data pipeline and infrastructure. Simply put, AI is built on data, and data runs on NetApp. So the question is: Is your data AI ready?		
Key points	Data Management • Access and manage multiple AI data sources to accelerate analytics, training, and inference across hybrid multicloud environments. • Deliver advanced data management capabilities and improve productivity by using the NetApp AI Control Plane. • Help your data scientists and engineers speed up time to insight. Use the Data Science Toolkit to automate AI training workflows. • Simplify, scale and integrate your entire AI data management workflow with validated software from our industry-leading AI partners.	Data Governance and Security • Rely on complete data protection, compliance and security no matter where data resides or migrates. • Protect against data exposure by removing sensitive or biased information from ingestion before it's used to train AI. • Increase auditability by helping data scientists eliminate errors and verify agency. • Identify cyber threats, including malicious insiders, in real-time with AI and ML-driven anomaly detection. • Safely access all types of data, including unstructured, for auto-tiering or cloning.	Sustainability • Learn how to use AI responsibly for lower energy consumption and reduced carbon footprint. • Create a more efficient data infrastructure to support intensive model training and deployment. • Enable streamlined access to energy-hungry GPUs and performant storage, allowing flexibility to use AI in hybrid multicloud environments.
Why NetApp AI?	A pioneer in AI data infrastructure, only NetApp enables customers to integrate, access and manage the full lifecycle of their AI data – anywhere. NetApp easily integrates into all leading MLOps platforms for best-of-breed performance and cost-effective data management.		
NetApp's AI Solution Benefits	• Free-flowing data pipeline: Consolidated and highly saleable data environment enables 5X more data through your AI pipeline. • Intelligence-driven speed: Get up to 5GBps throughput with well under 1ms of latency and create different tiers of data service to maximize GPU utilization in concurrent processing environments. • Fast, efficient dataset copies: Copies completed in minutes instead of hours or days, stored efficiently resulting in as much as 90% reduction in storage space. • Advanced storage capabilities: Modern open-source stack - Kubernetes, Kubeflow, NetApp Astra Trident, integrated data management – for simplified deployment, portability, and a cloud-anywhere experience for your AI. • Hit the ground running: Validated solutions, blueprints and Ansible integration for 20-minute configurations.		
Customer examples	• Cambridge Consultants: Uses AI for World-Changing Innovation • Hannover Medical School: Fights Chronic Lung Disease with Data. • Robovison: Democratizes AI with ONTAP AI and NVIDIA. • NISI Group: Revolutionizes Modern Surgery through Deep Learning with NetApp ONTAP AI.		

* <https://www.pwc.com/gx/en/issues/data-and-analytics/publications/artificial-intelligence-study.html>

You can check the box on digital transformation. It's old news. Today, you're seeing the beginning of AI transformation, supercharged by generative AI. It's already disrupting industries and jobs, while promising trillions in new economic value.* The democratization of AI tools means every employee is suddenly an "expert" in everything — because ChatGPT says so. The challenge now is capitalizing on the power of AI for your business while doing it responsibly.

Corporate data needs to stay protected but accessible for myriad AI uses cases. Each AI project requires an integrated, secure data pipeline and infrastructure, which means data governance and security have become more important than ever. Meanwhile, the network, storage and energy demands for AI could quickly cripple a less-than infrastructure. Which is why NetApp shines where others fail. NetApp operationalizes AI for the world's largest companies — responsibly.

While trendy consumer AI tools are grabbing headlines, businesses are working behind the scenes to see significant returns on their investments with transformative AI projects in healthcare, financial services, predictive maintenance, supply chain logistics, and many other real-world applications.

Unlocking the power of AI is almost completely dependent on the data that fuels it—accessing, governing, and using data in a continuous cycle that builds more value as data is analyzed and put to use. But this process is easier said than done. Not only is the volume of data massive and unrelenting, but it's scattered, often unstructured, and always a security risk. Disparate data silos and technology complexity are major hurdles to getting AI projects into production.

NetApp and its world-class partner ecosystem offer the most complete, powerful, and sustainable solutions to help clients capitalize on the best of AI. Simply put, AI is built on data, and data runs on NetApp. Now the question: Is your data AI ready?

MESSAGE BOARD | AI – Hoseb's edition

Overall message	AI transformation is here, supercharged by generative AI. It's already disrupting industries and jobs, while promising trillions in new economic value.* The challenge now is capitalizing on the power of AI for your business while doing it responsibly. Models need to be trained on Proprietary data while being protected but accessible for myriad AI uses cases. Each AI project requires an integrated, secure data pipeline and infrastructure. Simply put, AI is built on data, and data runs on NetApp. So the question is: Is your data AI ready?		
Key points	Data Management • Access and manage multiple data to accelerate analytics, training, and inference across hybrid multicloud environments. • Remove Data Management bottlenecks and increase data science productivity and time to insight. • Provide seamless access to data to train models through native data science tools such as Jupyter notebooks • Simplify, scale and integrate your entire AI data management workflow both on-premises and on the major hyperscalers.	Data Governance and Security • Rely on complete data protection, compliance and security no matter where data resides or migrates. • Protect against data exposure by removing sensitive or biased information from ingestion before it's used to train AI. • Increase auditability by helping data scientists eliminate errors and verify agency. • Identify cyber threats, including malicious insiders, in real-time with AI and ML-driven anomaly detection. • Provide tractability and reproducibility by versioning both code and data.	Sustainability • Learn how to use AI responsibly for lower energy consumption and reduced carbon footprint. • Create a more efficient data infrastructure to support intensive model training and deployment. • Enable streamlined access to energy-hungry GPUs and performant storage, allowing flexibility to use AI in hybrid multicloud environments.
Why NetApp AI?	A pioneer in Gen AI data infrastructure, only NetApp enables customers to integrate, access and manage the full lifecycle of their AI training data – anywhere. NetApp easily integrates into all leading MLOps platforms for best-of-breed performance and cost-effective data management.		
NetApp's AI Solution Benefits	• Free-flowing data pipeline: Consolidated and highly saleable data environment enables 5X more data through your AI pipeline. • Intelligence-driven speed: Get up to 5GBps throughput with well under 1ms of latency and create different tiers of data service to maximize GPU utilization in concurrent processing environments. • Fast, efficient dataset copies: Copies completed in minutes instead of hours or days, stored efficiently resulting in as much as 90% reduction in storage space. • Advanced AI Stack Integration: Modern open-source stack - Kubernetes, Kubeflow, NetApp Astra Trident, integrated data management – for simplified deployment, portability, and a cloud-anywhere experience for your AI model training. • Hit the ground running: Validated solutions, blueprints and Ansible integration for 20-minute configurations.		
Customer examples	• Cambridge Consultants: Uses AI for World-Changing Innovation • Hannover Medical School: Fights Chronic Lung Disease with Data. • Robovison: Democratizes AI with ONTAP AI and NVIDIA. • NISI Group: Revolutionizes Modern Surgery through Deep Learning with NetApp ONTAP AI.		

Buyer priorities and expectations.

1st draft based upon positioning input – Move tiles as needed until there is agreement

NetApp AI positioning worksheet

1st draft

* Once we have consensus on AI positioning, the content team will have the clarity they need to complete the AI messaging

FOR target organization	Companies actively looking to bridge their data analysis from BI to AI while simplifying and democratizing access to data for more people.
WHO statement of need	2023-2024 business strategy relies on unifying and upgrading legacy data environments across organizations to scale their AI initiatives
AND WANT statement of expectations	to strengthen their AI foundation to have the ability to analyze a variety of data types while adding additional data security and governance and have the option to move their AI environment between public clouds and on-premises data centers
THE solution	NetApp's AI Solutions are set of strategic and validated technical solutions based upon the company's award-winning storage and data management portfolio, multi-tier technical support, and consulting services — all based around a software-defined product strategy with exclusive NVIDIA and Arrow offerings not available from vendors. All this available in budget friendly offers for outright purchase and subscription-based deployment options
IS category	Dynamic scale-up and scale-out storage architecture and integrated data services developed using the worlds leading storage OS, ONTAP that enables optimal performance for multiple concurrent workloads (NFS/pNFS) and excellent Ethernet bandwidth (including NVMe/TCP, NFSoRDMA), alleviating the complexity of InfiniBand or parallel file systems.
THAT compelling reason to buy	Integrate and streamline workflows for data science teams and integrate multi-site/multi-platform data pipelines to maximize ROI and manage it through a NetApp's unified hybrid multicloud console, BlueXP. Get unified management of the entire data estate — services, resources, workloads, infrastructure, policies, protection, classification—on premises or in the cloud.
UNLIKE competitive alternative	Pure, Dell EMC, DDN, Weka or Vast miss in three areas: 1) None offer value-add AI tools such as NetApp AI control plane for full-stack, open-source tooling, or NetApp's DataOps toolkit boosting data scientist productivity 2) Partial integration with Nvidia and no exclusive offerings and 3) limited to poor native data protection and security
OUR SOLUTION statement of primary differentiation	We'll write this once we've come to agreement on the lines above

NetApp AI positioning worksheet

WIP input/revisions

* Once we have consensus on AI positioning, the content team will have the clarity they need to complete the AI messaging

FOR target organization	Companies actively looking to bridge their data analysis from BI to AI while simplifying and democratizing access to data for more people. This is too high-level marketing sentence. We should probably change this into “ Enterprise and Public Sector, Mid Large, Gen AI projects. Etc. A more general statement might be, For Companies actively looking to leverage AI to improve their top or bottom line FOR - companies may have a net new data science team for AI, to creating models to be competitive or to save time or to be more accurate. This is a net new team and effort, not a progression from BI work Large-to-mid-size firms in public and enterprise sectors aiming to achieve growth, innovate, and boost efficiency via large-scale AI initiatives.
WHO statement of need	2023-2024 business strategy relies on unifying and upgrading legacy data environments across organizations to scale their AI initiatives Struggle to with AI due to underestimated data preparation, non-standardized data definitions, inadequate data management, and distributed data sources, leading to protracted transformation processes
AND WANT statement of expectations	to strengthen their AI foundation to have the ability to analyze a variety of data types while adding additional data security and governance and have the option to move their AI environment between public clouds and on-premises data centers And Want... cloud-connected, enterprise-grade data pipelines that include governance and responsible AI. A strong AI foundation for varied data analysis, enhanced security, and flexible deployment, alongside enterprise-grade, cloud-connected data pipelines for effective AI scaling
THE solution	NetApp’s AI Solutions are set of strategic and validated technical solutions based upon the company’s award-winning storage and data management portfolio, multi NetApp AI Solutions are a set of solutions designed and developed from customer requirements and needs. These solutions represent design wins that customers are using WW to deliver AI results quicker and with less cost. -tier technical support, and consulting services — all based around a software-defined product strategy with exclusive NVIDIA and Arrow offerings not available from vendors. All this available in budget friendly offers for outright purchase and subscription-based deployment options ONTAP AI Integrated Solution - T-shirt sizing, ease of ordering and turn-key deployment it is about deploying high performance infrastructure for meeting the needs of AI model training either on prem, in the Cloud or hybrid. NetApp’s AI solutions are built on the world's leading storage OS incorporating advanced data services and customer-centric, cost-effective designs that shorten organizations time to insights. With full NVIDIA integration, global consulting and technical support, as well

For large-to-mid-size firms in public and enterprise sectors aiming to achieve growth, innovate, and boost efficiency via large-scale AI initiatives, the struggle to get meaningful data-driven results from their AI often arises because they've underestimated their current environment's capability to access, organize, and curate their disparate datasets to feed their AI projects at scale. This leaves them with inadequate data for their models or protracted, staff-intensive data transformation processes.

These buyers want a flexible data architecture capable of managing a wide variety of structured or unstructured data to feed their AI analysis. This includes enhanced data security and flexible deployment options, alongside enterprise-grade, cloud-connected data pipelines for data access and management. For these firms, the NetApp Data ecosystem is a data management solution that integrates with industry giants like Microsoft, Google, and NVIDIA to enable seamless AI control and collaboration, offers on-demand AI capabilities with partners like XXX?, and provides ease of integration with major cloud platforms. It's built on the world's leading storage OS, ONTAP, and designed to deploy scalable and performant data ecosystems within weeks rather than years. With full NVIDIA integration, global consulting, and technical support, as well as flexible consumption options, buyers get a high-performance data architecture matched to their AI ambitions and deployable on-premises, in a public cloud, or hybrid environment, giving them near-instant impact for an affordable investment.

Having spent over three decades perfecting dynamic scale-up and scale-out storage architectures and integrated data services, NetApp is a market leader in AI solutions. For organizations requiring extreme machine learning and deep learning (ML/DL) workloads, NetApp offers industry-leading throughput, and for those with less-demanding needs, NetApp's AI solutions can reduce data management overhead and complexity. Finally, NetApp's AI solutions come with value-add tools such as the AI Control Plane and DataOps toolkit, ensuring auditability and governance, easily managed through NetApp's unified hybrid multicloud console, BlueXP. With BlueXP, all AI solution customers can manage their entire data estate through a single console regardless of where the organization's data resides, providing a comprehensive, flexible, and efficient solution to move AI projects into production.

Short NVIDIA Pitch ideas: **WIP**

1. Your AI Capabilities Enhanced: With the ONTAP AI solution, developed in partnership with NVIDIA, you can leverage a combination of NVIDIA's processors and NetApp's data storage to support your AI workloads. That means a more streamlined approach to managing large volumes of data across various environments, from edge to core to cloud.
2. Collaborative Solutions Tailored for You: NetApp and NVIDIA's joint efforts include the creation of High-Performance Computing (HPC) and AI Centers of Excellence, and the development of the Base Command Platform. These solutions provide you with tailored options for AI development and the NetApp ONTAP AI Reference Architecture, which can be powered by NVIDIA DGX and NetApp all-flash storage. It means more customization and integration with your specific needs.
3. Quantified Performance: The partnership between NetApp and NVIDIA has led to advancements in AI-related hardware and software capabilities. For example, the joint activity around NVIDIA's DGX SuperPOD and BasePOD ensures you receive optimal performance for your specific workload requirements. **[quantify here]**
4. Your Future, Simplified and Data-Driven: As stated by NVIDIA's Renee Yao, "NVIDIA and NetApp, we're at the very beginning of creating our future—a future that is connected, convenient, and data-driven." This partnership aims to simplify your AI journey and ensure that your organization's future is shaped by accessible and well-managed data.
5. Flexible Options for Your AI Ambitions: Whether you need to build High-Performance Computing centers or deploy solutions like the NetApp ONTAP AI Reference Architecture, the collaboration between NetApp and NVIDIA ensures you have the flexible options to match your AI ambitions. That means a more comprehensive and efficient approach to moving your AI projects into production, tailored to your organization's specific needs and scale.

NetApp AI value property worksheet

Version 3 WIP
testing with analysts during Aug

FOR target organization	Large-to-mid-size firms in public and enterprise sectors aiming to achieve growth, innovate, and boost efficiency via large-scale AI initiatives.
WHO statement of need	Struggle to get meaningful data-driven results from their AI because they've underestimated their current environments capability to access, organize, and curate their disparate datasets to feed their AI projects at scale. This leaves them with inadequate data for their models or protracted, staff-intensive data transformation processes.
AND WANT statement of expectations	A flexible data architecture capable of pulling from a wide variety of structured and unstructured data to feed their AI analysis that includes enhanced data security, and flexible deployment options, alongside enterprise-grade, cloud-connected data pipelines for data access and management so they can finally move their AI projects into production.
THE solution	NetApp's storage and data services solutions for AI - <i>built on the world's leading storage OS</i> - were developed through real-world customer-driven use cases then converted to functional frameworks and reference architectures so organizations could quickly deploy highly scalable and performant data ecosystems suited to their needs within weeks rather than years. With full NVIDIA integration, global consulting and technical support, as well as flexible consumption options, buyers get a high-performance data architecture, deployable on-premise, in a public cloud or hybrid environment giving them near-instant impact with an affordable investment
IS category	Dynamic scale-up and scale-out storage architecture and integrated data services underpinned by the world's leading storage OS, ONTAP that enables optimal performance for data driven AI while also handling other concurrent workloads reducing data management overhead and complexity for already taxed technology teams.
THAT compelling reason to buy	Integrate and streamline workflows for data science teams and integrate multi-site/multi-platform data pipelines that maximize ROI and are easily managed through NetApp's unified hybrid multicloud console, BlueXP. Through BlueXP, AI solution customers get unified management of the entire data estate — services, resources, workloads, infrastructure, policies, protection, classification—wherever the organizations data resides.
UNLIKE competitive alternative	Pure, Dell EMC, DDN, Weka or Vast none of whom offer 1) value-add AI tools such as NetApp AI control plane for full-stack, open-source tooling, or NetApp's DataOps toolkit boosting data scientist productivity 2) built in data protection so their buyers must integrate a 3 rd party cyber resilience suite, and 3) first party cloud integration with hybrid/multicloud data management like Blue XP
